13 JAN 1971

MEMORANDUM FOR: Director, CIA Reconnaissance Programs

SUBJECT: Program Progress Report

Forwarded herewith are three copies of the IDEALIST

Program Progress Report for the period 1 October 1970
31 December 1970.

25X1

Brigadier General, USAF Director of Special Activities

IDEALIST

DEVELOPMENT SUMMARY AND PROGRESS

(1 OCTOBER 1970 - 31 DECEMBER 1970)

I. AIRFRAME

A. New Emergency AC Generator - Test generator number one has completed over 700 hours of test operation in the LAC altitude chamber. Tests have shown that generator temperatures are held within specifications when delivering 8.5 KVA. Test generator number two has been installed in aircraft 054 and is presently undergoing flight service evaluation at Detachment G.

II. PROPULSION

- A. Sealed Crossover Tubes The 200 hour flight service evaluation of improved engine combustion chamber sealed crossover tubes at Detachment G was completed. Teardown report indicated excellent condition and the engine was reinstalled for use until normal hot section inspection at 400 additional hours.
- Fuel Control A modified fuel control was installed in Article 054 during the week of 16 November 1970, for continued flight evaluation. This fuel control incorporates a new uprated manual (Emergency) schedule with the installation of a new PT2 bias cam designed to provide added fuel flow at lower altitudes to permit an adequate climb capability in emergency mode.

III. PAYLOAD

25X1

"H" Configuration - Double imagery associated with camera hatch window junctions was encountered on missions. These missions combined low aiming angles with type 3414 film to produce noticeable double imagery. The new type 3414 film is more sensitive than previous film to the light transmitted through a second window. Viewing at low angles where the hatch window junction is in the field of view allows light from two pieces of glass to enter the lens system. By masking off the secondary window, double imagery has been eliminated.

B. Life Support Equipment 1. Six-Line Release - The test program covering Engineering Change Proposal U-2R-61 concerning control of Personnel Parachutes began at LAC, Burbank, California, in early December 1970. Live-jump tests, using the S-1010 Pilot Protective Assembly (PPA) and the 901-J Full-Pressure Suit, are scheduled to begin at the El Centro, California, Test Facility on 9 February 1971. 2. Tree-Lowering Device - This device is now a standard part of the RQ-225 Parachute Assembly and all parachutes are being modified as they go through LAC for repack. The first two modified chutes arrived at Detachment H on 16 November 1970. 3. White Outer Coverall for S-1010 PPA - During the past summer project pilots were experiencing heat problems at maximum altitude especially on the back of the hands and on the thighs. As a possible solution, a new white, outer coverall of fire suppressant nomex was fabricated and test flown. Results were optimistic and new white coveralls are now in service for all project pilots. 4. Four S-1010 PPA's were delivered to Detachment H in November 1970 to provide a two-suit capability C. Training 1. During the first week of December 1970 physiological training, including a full-pressure suit chamber flight and explosive	pproved For Release 2004/02/11 : CIA-RDP75B00285R000300150033-7	2 25
